

Energy is consumed by our buildings and our modes of transportation - both significantly affected by land use.

The energy is supplied by a variety of sources, each with varying GHG consequences (emission factors).

The amount of energy supplied by each source, multiplied by that source's emission factor equals GHG emissions.

Emission Factors (kg CO ₂ e/GJ)	
natural gas	49
electricity	0.0001
diesel	68
gasoline	73
green (various sources)	0
